www.namethatplant.net

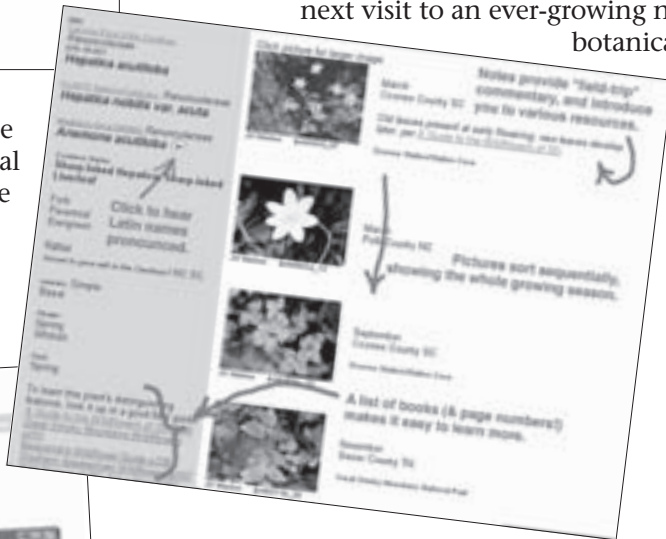

NameThatPlant.net is a **clearinghouse of information** about native and naturalized plants of the Carolinas and Georgia.

You can **search** for a plant by its common or scientific name, or by the family that it belongs to.

You can ask for a list of native plants recommended for landscapes or to attract wildlife. You can describe a plant that you've seen and ask for plants that meet those criteria. And you can access a list of plants that you might see on your next visit to an ever-growing number of botanically interesting areas.

On the plant detail page, you will **see** the plant's scientific names, as cited by several authorities. Most field guides will use one of these names.

If there is a button beside the name, you can click it to **hear** the Latin name pronounced.

Other information is displayed on this page too, such as when to expect the plant to bloom and the fruit to ripen, whether the leaves are alternate or opposite, simple or compound, the flower color, type of fruit, whether the plant is known to grow wild in this area, and if it is considered invasive.

Photographs are displayed for many of the plants, showing leaves, fruit, bark, and habit, as well as flowers. The pictures **sort sequentially** to show *seasonal changes*.

Some of the photos are **accompanied by notes** pointing out specific features to look for, much as a teacher might mentor a student. As pictures are paired with verbal descriptions, the viewer learns not only to *see*, but he gradually becomes acquainted with the vocabulary of botany.

Clicking a "thumbnail" photo provides a larger image.

You can compare confusingly similar plants side by side, like a police line-up!
